

IPL Dashboard 2023–2026

An interactive dashboard built to turn four seasons of IPL match data into a clear, at-a-glance performance overview.

Project Report

Prepared July 2026

Tools: Microsoft Excel · Pivot Tables · Pivot Charts · Slicers

6.	Key Insights & Recommendations	6
7.	Closing Thoughts	6

1. Executive Summary

Two hundred and fifty matches, four seasons, and one dashboard that turns a decade's worth of scorecards into a single page of insight.

This report walks through an IPL performance dashboard covering all ten franchises across the 2023–2026 seasons. Rather than leaving match results scattered across scorecards and season archives, the dashboard consolidates every match, run, wicket, and result into KPI cards, charts, and interactive slicers so that an analyst, broadcaster, or fan can ask a question — "which team has been the most consistent winner?" or "is scoring going up or down season by season?" — and get an answer instantly.

The headline numbers: 250 matches played, 88K runs scored, 3K wickets taken, and a highest individual score of 286, across 4 seasons and 10 teams. Royal Challengers Bangalore lead the win count with 14 wins and the highest win percentage, while Chennai Super Kings (2023) and Kolkata Knight Riders (2024) each collected a title before Royal Challengers Bangalore claimed back-to-back championships in 2025 and 2026. The sections below unpack how the dashboard reaches these conclusions and what they suggest about the competitive landscape.

2. Project Overview & Objectives

The IPL Dashboard was built to make four seasons of match data usable without digging through individual scorecards. Raw match-by-match records rarely tell a story on their own — it takes structure, visualization, and the ability to slice by season or team before patterns start to emerge. That's exactly what this dashboard does: it takes match, run, wicket, and result data and reorganizes it into a format where team form, scoring trends, and championship history become visible at a glance.

The project was guided by a few clear goals:

- Give a real-time, at-a-glance view of overall tournament statistics across all four seasons
- Rank teams by wins and win percentage, not just raw match counts
- Surface season-by-season trends in matches played and runs scored
- Track total runs, wickets, and the highest individual score alongside match counts
- Make each season's champion instantly visible, without digging through archives
- Let users explore freely by season and team through slicers, without touching the underlying data

3. Tools & Dashboard Features

Everything here was built natively in Microsoft Excel — no external BI software — using Pivot Tables and Pivot Charts as the analytical backbone, Slicers for interactivity, and icon-led KPI cards for quick reads. The underlying match data went through a cleaning pass before analysis to standardize team names and handle any inconsistent records.

Interactive Filters

Two slicers sit at the top of the dashboard — Season (2023–2026) and Team — and they can be combined freely. Selecting either instantly refreshes every KPI card, chart, and the team-details table on the page.

KPI Cards

Six icon-led cards anchor the top of the dashboard: Total Matches, Total Runs, Total Wickets, Highest Score, Total Seasons, and Total Teams — designed to answer the first question anyone asks about a tournament — "how big was it?" — before a single chart is read.

Visualizations

The dashboard combines a bar chart (Total Match Wins by team), a donut chart (Winning Percentage share), two trend charts (Total Matches by Year and Total Runs by Year), a detailed sortable Team Details table, and a dedicated Champion strip showing each season's title-winning franchise.

4. Walkthrough of the Dashboard

The clearest way to understand what this dashboard can do is to look at it in action — the view below shows the full, unfiltered four-season dataset.

4.1 Overall Performance Overview — Full Dataset, No Filters Applied

The unfiltered master view — every match, every team, every season, all at once.

This is the dashboard at rest, showing all 250 matches across four seasons. **Royal Challengers Bangalore** lead the win count with 14 victories, just ahead of a tightly packed group of Gujarat Titans, Mumbai Indians, and Sunrisers Hyderabad at 13 wins each; Lucknow Super Giants sit at the bottom of the ladder with 9. The winning-percentage donut tells a similar story from a different angle — Royal Challengers Bangalore hold the largest single slice at 12%, with most other teams clustered closely between 8% and 11%, suggesting a competitive league without one dominant outlier.

The Team Details table adds nuance that the win-count chart alone can't show: Royal Challengers Bangalore's 53.85% win rate is the best in the league, but Mumbai Indians (52.00%) and Sunrisers Hyderabad (52.00%) are close behind on a per-match basis, while Lucknow Super Giants' 37.50% win rate is the clear outlier at the bottom. Season by season, matches played rose from 63 in 2023 to a steady 74 in both 2024 and 2025, before dropping to 39 in 2026 — almost certainly reflecting a partial season rather than a real decline in the tournament's scale. Total runs by year follow the same shape, climbing from 22K to a plateau of 26K before the

shortened 2026 season's 14K.

The Champion strip closes the loop on the season-by-season story: **Chennai Super Kings** won in 2023, **Kolkata Knight Riders** took the title in 2024, and **Royal Challengers Bangalore** have gone back-to-back in 2025 and 2026 — a run that lines up neatly with their league-leading win count and win percentage in the season-level data above.

5. Chart Reference Guide

For quick reference, here's what each visualization on the dashboard is built to answer:

Chart	What it answers
Total Match Win	Which teams have won the most matches across all seasons
Winning Percentage	How each team's share of total wins compares to the rest of the league
Team Details Table	The full win/loss/win% breakdown for every franchise, sortable and precise
Total Matches by Year	Whether the tournament's scale is growing, shrinking, or holding steady
Total Run by Year	How scoring volume has trended season over season
Champion of 2023–2026	Which franchise won each season's title, at a glance

6. Key Insights & Recommendations

Pulling everything together, a few findings come through clearly:

- Royal Challengers Bangalore are the league's most consistent performer over this period, leading in wins, win percentage, and the only franchise to win back-to-back titles (2025 and 2026).
- The league is competitive rather than top-heavy: outside of Royal Challengers Bangalore, seven of the remaining nine teams sit within a narrow 8–11% winning-percentage band.
- Lucknow Super Giants are the clearest underperformer, with the lowest win percentage (37.50%) by a meaningful margin.
- 2026's lower match and run totals almost certainly reflect a partial or shortened season rather than a genuine decline in scoring or scale, and should be annotated as such in any year-over-year comparison.
- Scoring volume (Total Runs by Year) tracks closely with matches played, indicating a fairly stable average-runs-per-match rate across seasons rather than a scoring-rate shift.

Based on these patterns, a few practical next steps are worth considering: flag 2026 as a partial season in any trend chart to avoid misreading it as a decline; take a closer look at Lucknow Super Giants' underlying match data to understand what's driving their below-average win rate; and extend the dashboard with a per-season (rather than cumulative) win-percentage view once more seasons are added, to track whether Royal Challengers Bangalore's dominance is sustained or a recent peak.

7. Closing Thoughts

What this project really demonstrates is that Excel, used well, can do far more than store scores — it can become a genuine decision-support tool. With nothing more than Pivot Tables, Pivot Charts, Slicers, and a bit of careful formatting, four seasons of match records turn into something an analyst can actually interrogate: filter it by season or team, compare franchises side by side, and trust the answer that comes back.

This dashboard is offered as a working example of that idea — practical, interactive, and built to support real conversations about team form and tournament trends, not just report on the past.
